

AI CLIENT-SERVER ARCHITECTURE

BLOCKCHAIN-BASED ACADEMIC CERTIFICATE VERIFICATION

Component Explanation

1. Client Layer

- Interface used by students, universities, and employers.
- Uploads certificates for verification.
- Displays verification status and certificate details.

2. Server Layer

- Handles requests from users.
- Connects the client with AI and blockchain services.
- Processes verification results and sends responses.

3. AI Model Layer

- Analyzes certificate information.
- Detects fake, modified, or duplicate certificates.
- Validates certificate data before verification.

4. Database Layer

- Stores academic certificate records.
- Maintains blockchain hashes for security.
- Ensures certificates cannot be altered without detection.

Working of the System

1. Student uploads a certificate.
2. Server receives the request.
3. AI checks certificate authenticity.
4. Blockchain record is matched.
5. Database retrieves certificate details.
6. Verification result is sent back to the user.

Objective

To provide a secure, transparent, and tamper-proof system for verifying academic certificates using Blockchain technology and AI.
